## INTRODUCTORY

It gives us great pleasure to announce to our patrons that after seventeen years of constant business in engineering work of great magnitude, we have found it essential to incorporate in the District of Columbia under an act of Congress governing Corporations, the laws of which are probably the strictest in this country.

We have in our employ a corps of skilled electrical, mechanical and civil engineers, with every possible facility to design and equip the most complete steam, electric and hydraulic plants.

We prepare preliminary reports on surveys, furnish specifications and plans for the complete installation of power plants in Buildings and Factories. We also have specialists for steam heating and steam power work, electric lighting and electric power work, electric transmission as well as complete electric railway installations.

We have Engineers experienced in building Refrigerating and Cold Storage Plants as well as Vacuum cleaning apparatus, Steam Laundries and Elevators.

We also have specialists in steel structural work, who give special attention to the preparation of specifications and plans for steel frame work as required for the construction of Bridges, Buildings, and Factories.

While this Company does a great deal of consulting engineering work, preparing plans and specifications, supervising and making tests and reports on the general engineering work above mentioned, we are also Constructing Engineers and will submit proposals for complete installations of any general engineering work.

We call attention to the illustrations showing the various phases of some of our important work.

The President and General Manager of our Company has had a most extensive experience covering twenty years of constant business in all branches of Engineering Work handled by us throughout the United States, as well as in Asia and Europe, keeping constantly in touch with the most modern developments of the engineering world, having recently served as the Sole Consulting Engineer to the Commission on Award for the United States Congressional Power Plant, consisting of four (4) 2,000 K. W., A. C. Generators and four (4) 3,000 H. P. Turbines, together with 15,000 H. P. Steam Boilers, Sub-stations, etc., the work in this connection entailing a personal inspection of the most important steam and electrical installations in this country during the past year.
